

Cloud Architecture for CI/CD

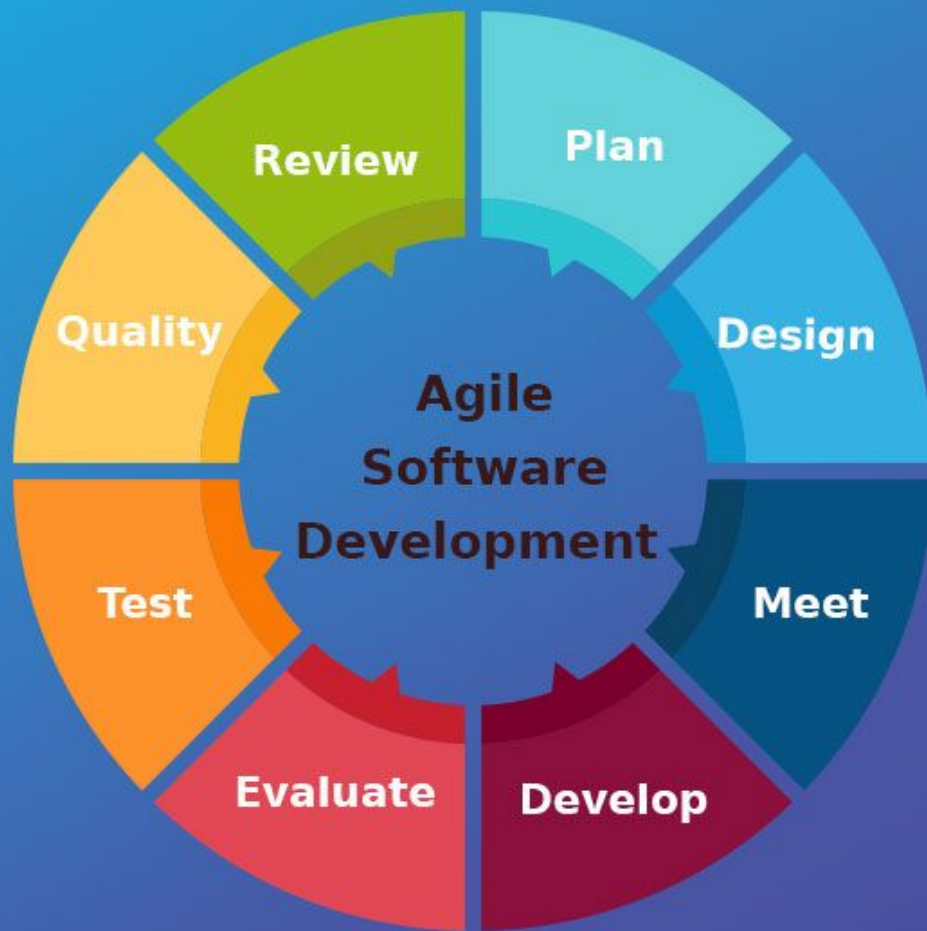

Dwi Prasetyo Adi Nugroho
Haydar Ali Ismail

Lean Startup

Minimize **TOTAL** time through the loop

What and why CI/CD?

Agile

focuses on
processes

highlighting
change

while accelerating
delivery

CI/CD

focuses on
software-defined life cycles

highlighting
tools

that emphasize
automation

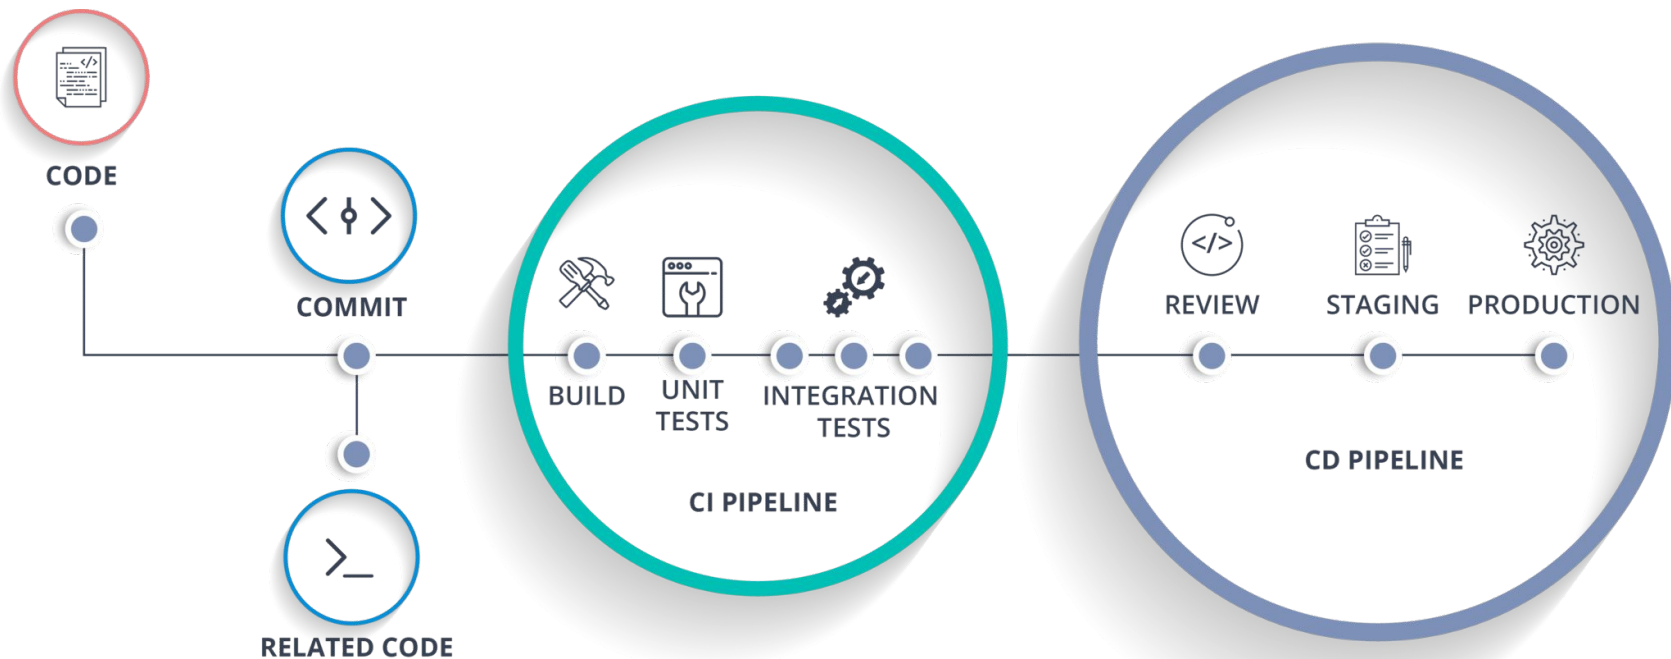

DevOps

focuses on
culture

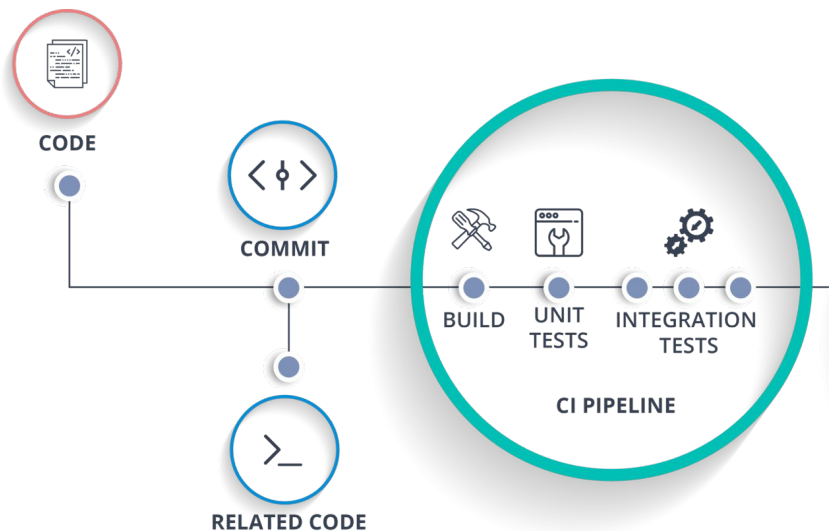

highlighting
roles

that emphasize
responsiveness

Overview of CI/CD Pipelines

Continuous Integration

- Integrate **frequently**
- Verified by an **automated** build
- Followed by **automated** tests

CI: Automate Build

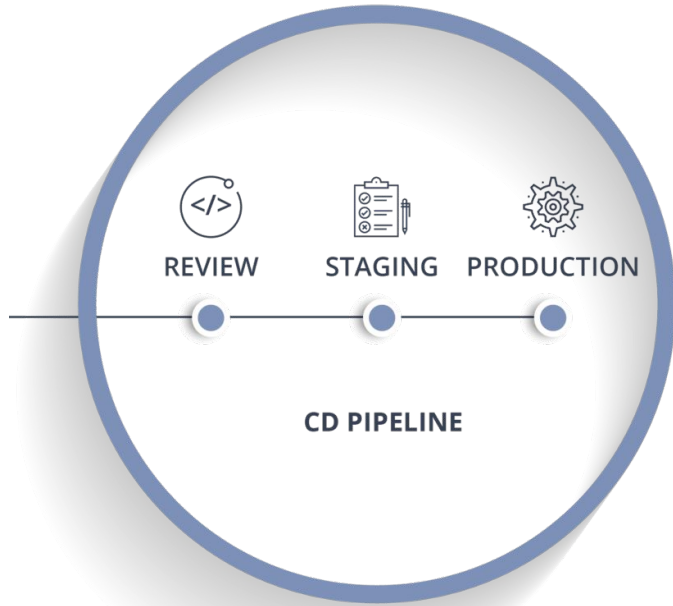

- Build is a **repetitive** task
- **Automation** can be done through pre-prepared script
- May include things like **automatic** database migration, **automatic** flushing cache, etc
- Failures will be notified to developers

Summary: 19 builds failing out of 47 builds.			
	piwik / piwik-ui-tests	 Piwik Automation  less than a minute ago	Running
	piwik / device-detector	 sgiehl  20 minutes ago	Build success
	piwik / plugin-LoginLdap	 diomosis  25 minutes ago	Build success
	piwik / piwik	 Matthieu Aubry  about 11 hours ago	Build success
	piwik / piwik-java-tracking	 Fabian Becker  a day ago	Build success
	PiwikPRO / plugin-CloudAdmin	 Michal Gaddzik  a day ago	Build failure
	mnapoli / BlackBox	 Matthieu Napoli  a day ago	Build success
	piwik / plugin-VisitorGenerator	 Thomas Steur  3 days ago	Build failure
	piwik / component-decompress	 Matthieu Napoli  4 days ago	Build success

CI: Automated tests

- Scripts to test software
- “Manual testing only considers the functionality of one aspect of a system at one point in time.”
- Several examples:
 - Unit tests: code-level check
 - API tests: test between services
 - Functional tests: user scenario tests
 - Etc...
- Results will be notified to developers

CD

- **Review** built file
- Ideally, deploy it first to “**staging**” environment
 - Staging = clone of production environment
- People can test out staging environment for things that cannot be tested during automatic tests
- After staging tests, app deployed to production

Continuous Delivery vs Continuous Deployment

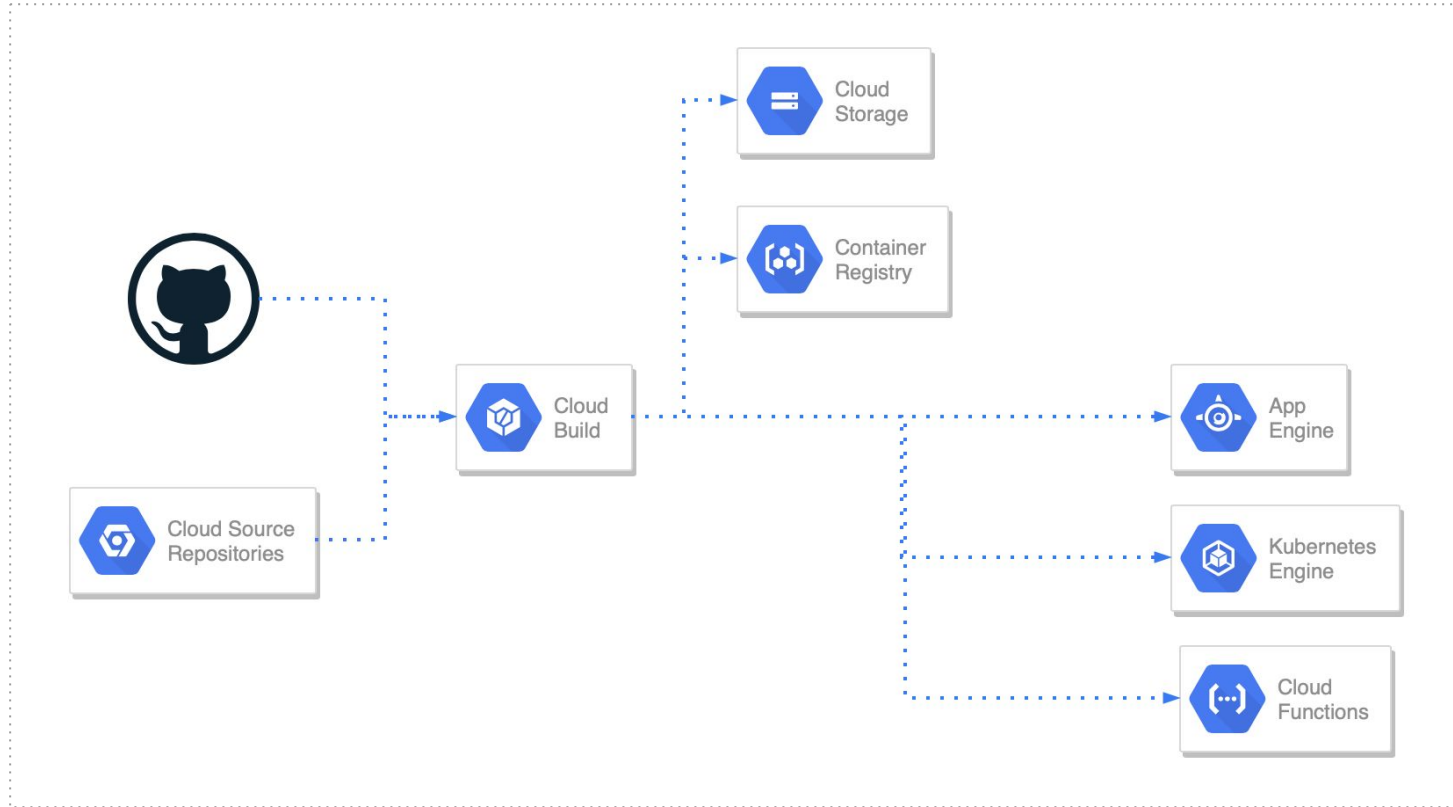

Continuous Delivery

- Code in main branch ready to deploy
- **Require** human interaction to deploy
- Suitable for project that require non-technical aspects to release features

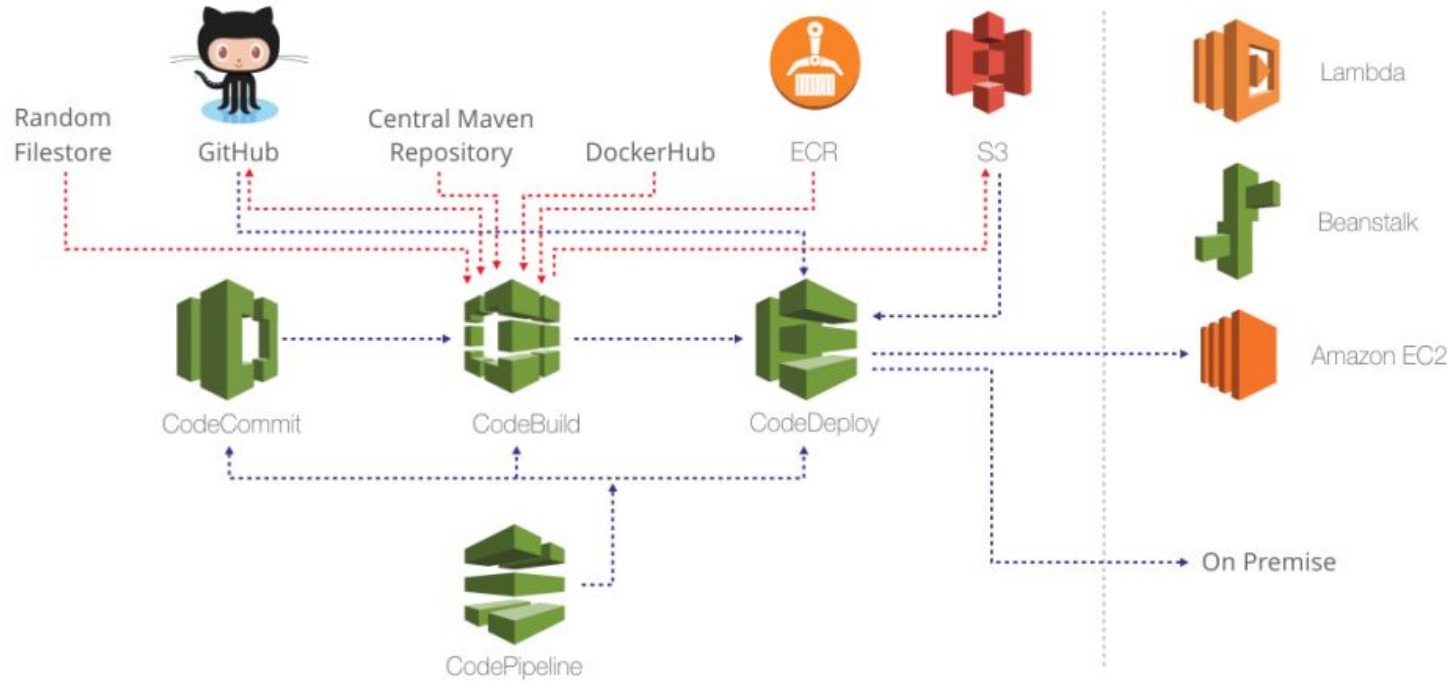

Continuous Deployment

- Code in main branch ready to deploy
- **Automatically** deployed
- Suitable for project that end-users can receive new features as soon as it's ready

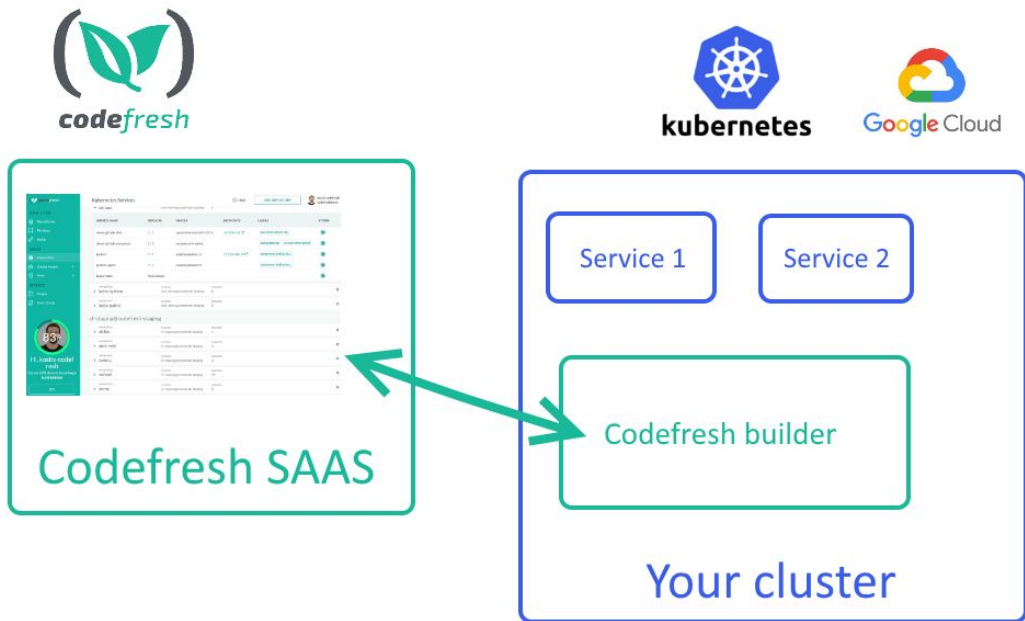

Google Cloud Platform

Amazon Web Service

Others - On Top of AWS/GCP

Demo on GCP - Setup

- GCP Account, Project, and GCP Client/SDK
- Cloud Build, Cloud Storage, App Engine + GitHub
- Creating a simple API Service
- *GO* : main.go & main_test.go + app.yaml

```
// main.go
package main

import (
    "fmt"
    "net/http"
)

func homeHandler() func(w http.ResponseWriter, r *http.Request) {
    return func(w http.ResponseWriter, r *http.Request) {
        fmt.Fprintf(w, "Hello World! ")
    }
}

func main() {
    http.HandleFunc("/", homeHandler())
    http.ListenAndServe(":8080", nil)
}
```

```
// main_test.go
package main

import (
    "net/http"
    "net/http/httptest"
    "testing"
)

func TestMain(t *testing.T) {
    http.HandleFunc("/", homeHandler())
    req, _ := http.NewRequest("GET", "", nil)
    w := httptest.NewRecorder()
    hf := http.HandlerFunc(homeHandler())
    hf.ServeHTTP(w, req)
    if w.Code != http.StatusOK {
        t.Errorf("Home page didn't return %v", http.StatusOK)
    }
}
```

```
# app.yaml
runtime: go112
```

Demo - Cloudbuild.yaml

steps:

- name: 'gcr.io/cloud-builders/go' args: ['build', 'awesome-api']
- name: "gcr.io/cloud-builders/go" args: ['test', './...']
- name: 'gcr.io/cloud-builders/gcloud' args: ['app', 'deploy', 'src/awesome-api/app.yaml'] timeout: '600s'

artifacts:

objects:

location: 'gs://awesome-api-bin'

paths: ['awesome-api']

Demo on GCP - Structure

```
.
├── cloudbuild.yaml
└── src
    ├── awesome-api
    │   ├── main.go
    │   └── main_test.go
```

← Create trigger

Trigger settings

Source: GitHub Repository: <https://github.com/dpanugroho/awesome-api>

Name

Push to master branch

Trigger type

☒ Branch

☐ Tag

Branch (regex)

Matches the branch: master

master

Included files filter (glob) (Optional)

Changes affecting at least one included file will trigger builds

glob pattern example: src/*

Ignored files filter (glob) (Optional)

Changes only affecting ignored files won't trigger builds

glob pattern example: .gitignore

Hide included and ignored files filters

Build configuration

☐ Dockerfile

☒ Cloud Build configuration file (yaml or json)

Specify the path within the Git repo

Specify the path to a Cloud Build configuration file in the Git repo [Learn more](#)

Cloud Build configuration file location

/ cloudbuild.yaml

Substitution variables (Optional)

Substitutions allow to re-use a cloudbuild.yaml file with different variable values [Learn more](#)
